rerformance

rambo 2014.7

o What is Performance?

performance

- o a measure that relates time to the executions of individual tasks
- Performance is an altribute of each individual experience with a system.

LIME

the indefinite continued progress of existence and events in the past, present, and future regarded as a whole: "Time is what prevents everything from happening at once." —John Archibald Wheeler (1911-2008)

Cask

- o a piece of work to be done or undertaken
- A task is a business unit of work, named and described in the language of the business.

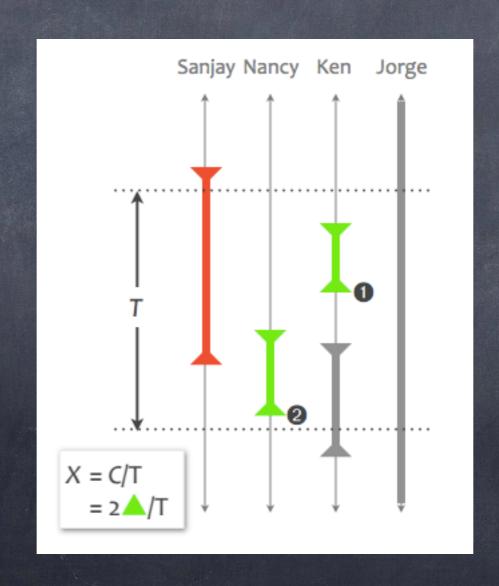

CXPCTLCMCC

o an execution of a task.

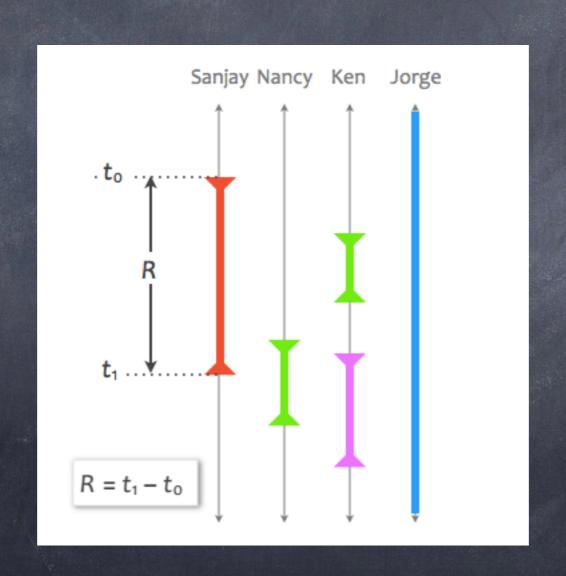

- o Two ways to relate experiences to time
- o experiences/time
- o time/experience

- a throughput
 - output or production, as of a computer program, over a period of time
- o response time
 - e the duration taken for a system to react to a given stimulus or event

o throughput (X) = periodices/time

o response time (R) = time/experiences

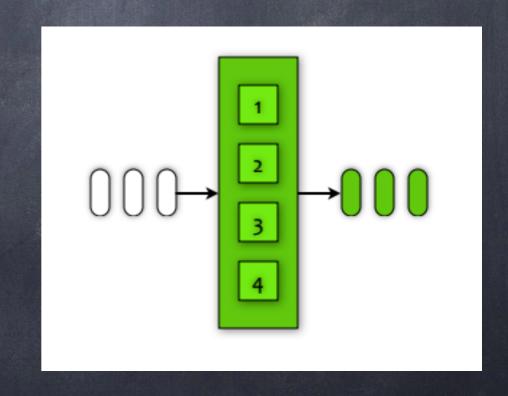

- Throughput is important to groups, leaders.
- Response time is important to individuals, leaders.

$$X(N) = \frac{N}{R(N) - Z}$$

o average response time

$$R(N) = \frac{N}{X(N)} + Z$$

- Case:收费站
- o N:通道数, Z:常量(waiting time)
- @ N=4, Z=0
- o if R(N)=1, then X(N)=4
- o if X(N)=8, then R(N)=0.5

rerentile

o all response must be in <= 1.0s

COSC. 1—SCCCOAC. List A

- o which response times do you like better
- @ R(N)= 1.0s

R(N)
A 1.000 s
B 1.000 s

| | List A | List B |
|----|--------|--------|
| 1 | .924 | .796 |
| 2 | .928 | .798 |

しつにしているでは浅区

bottleneck - busiest resource on the system while your task runs

- @ Boltleneck is defined in the context of a task execution.
- o Different experiences on a given system have different bottleneck.

Amdahl's Law

A task's response time can improve only in proportion to how much the task uses the thing you improve.

$$C(N) = \frac{N}{1 + \alpha(N - 1)}$$

| | Response time | | Potential ponse time improvement | |
|---|---------------|--------|----------------------------------|-----------|
| 1 | 1,748.229 | 70.8% | 35.4% | 1,000,000 |
| 2 | 338.470 | 13.7% | 12.3% | 1 |

Skew

- o a non-uniformity in a list
- e what fouls your ability to predict results

Quiz: How much time will you save if you eliminate half of the 10,013,394 "abfiles equential read" calls?

| CALL-NAME | DURATION | % | CALLS | MEAN | MIN | MAX |
|----------------------------|---------------|--------|------------|----------|----------|-----------|
| db file sequential read | 59,081.406102 | 76.6% | 10,013,394 | 0.005900 | 0.000010 | 15.853019 |
| log buffer space | 6,308.758563 | 8.2% | 9,476 | 0.665762 | 0.000004 | 1.010092 |
| free buffer waits | 4,688.730190 | 6.1% | 200,198 | 0.023420 | 0.000004 | 1.021281 |
| EXEC | 4,214.190000 | 5.5% | 36,987 | 0.113937 | 0.000000 | 5.400000 |
| log file switch completion | 1,552.471890 | 2.0% | 1,853 | 0.837815 | 0.000006 | 1.013093 |
| 22 others | 1,303.198855 | 1.7% | 70,400 | 0.000402 | 0.000000 | 8.964706 |
| | | | | | | |
| TOTAL (27) | 77,148.755600 | 100.0% | 10,332,308 | 0.007467 | 0.000000 | 15.853019 |

- o Depends on which half?
- Eliminate the green ones (93% of calls), and you'll save
 0.3% of time.
- Eliminate the red ones (just 5% of calls), and you'll save 98.5% of time.

| | RANGE {mi | n ≤ e < max} | DURATION | % | CALLS | MEAN | MIN | MAX |

MEMERMEZEMO RESIE

- o Efficiency
 - o an inverse measure of waste
- o waste
 - any work that could be eliminated without sacrificing useful benefits

o to measure efficiency, profile.

The fastest way to do something is to not do it at all.

Load

o competition for a resource by concurrent task executions

- o busier -> more waiting
 - o queueing delay
 - o coherency delay

Cucucus Delay

o time spent waiting in a queue for access to a shared resource

coherency delay

 time spent communicating and coordinating access to a shared resource

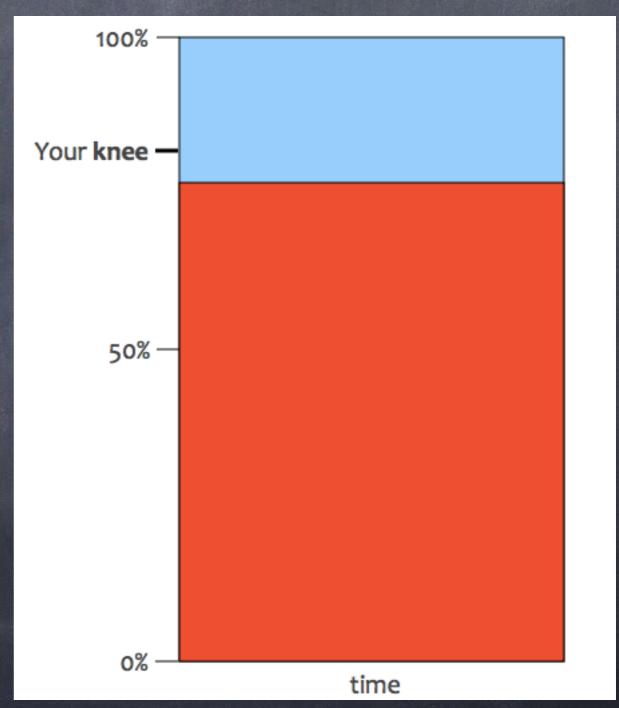

TAC KINCE

- o Goals
- o response time)
- o throughput 1

- the resource utilization value at which throughput and response time are in optimal balance
- @ Every resource has a knee.

Capacity Planning

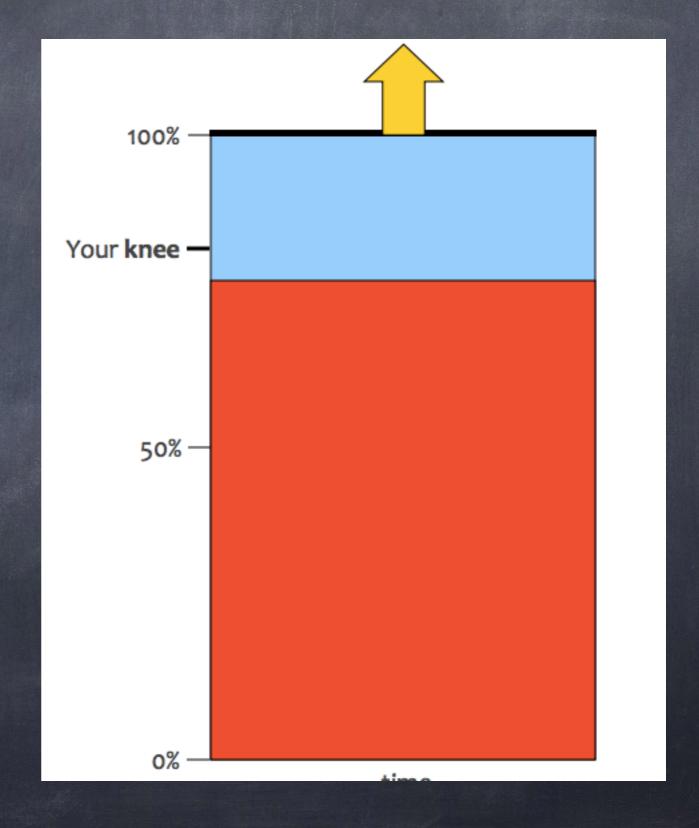

e capacity

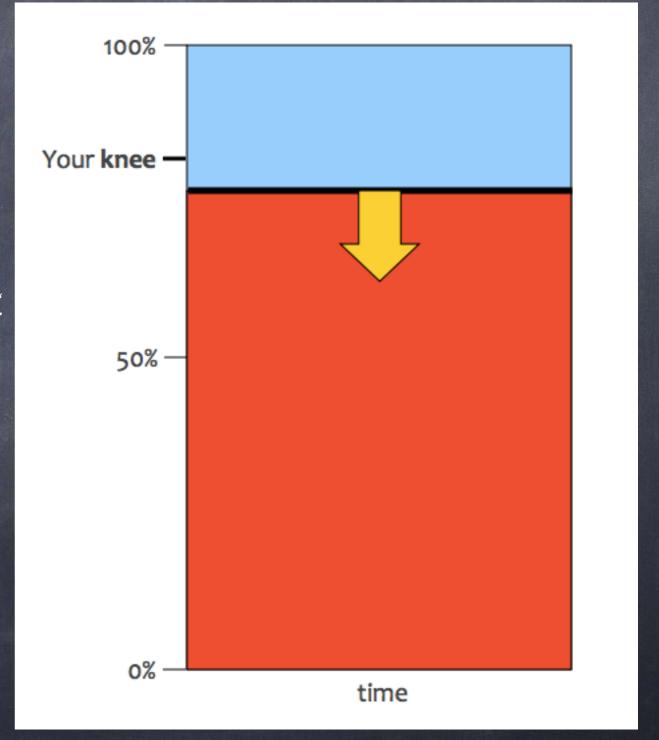

planning = How

big must

capacity be?

e load management = How small must load be?

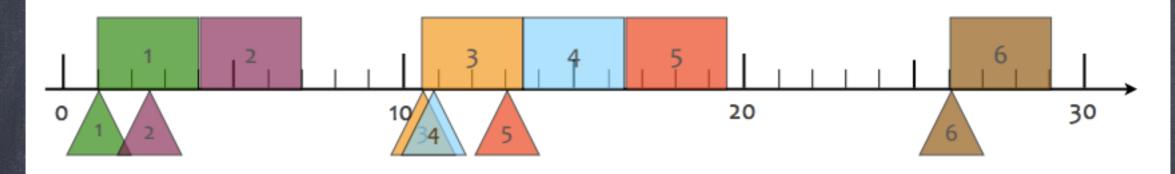

- e to perform well, you must
- o mahage your load
- so that utilizations on resources with arrivals
- o do not exceed their knees.

- e When Load exceed a knee, you need to
- o reschedule load,
- o or eliminate load,
- o or increase capacity.

random arrivals

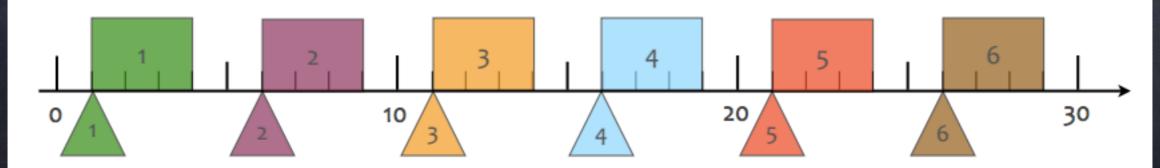

Random arrival process

A = 6 arrivals, T = 30 sec, $\lambda = .2$ arrivals/sec, S = 3 sec, R = 4.267 sec

Deterministic arrival process

A = 6 arrivals, T = 30 sec, $\lambda = .2$ arrivals/sec, S = 3 sec, R = 3.000 sec

- o deterministic arrivals:
 - o you can run up to 100% utilization
- o random arrivals:
 - ø you must pay altention to your knees.

rerformance Test
